

Antineoplastic and other hazardous drugs present a risk to health care personnel if they are not contained by appropriate facility design, personal protective equipment, and work practices that support safety” Kienle(2019).

Abstract:

Antineoplastic and other hazardous drugs present a risk to health care personnel if they are not contained by appropriate facility design, personal protective equipment, and work practices that support safety. These drugs pose the risk of carcinogenicity and reproductive risks to personnel, which can be mitigated by using the proper containment practices.
