

This article addresses the current evidence base for correction of preoperative anaemia, normalization of iatrogenic and pathological coagulopathy, intraoperative strategies for optimal blood product usage and management of postoperative anaemia” Swift et al (2019).

Abstract:

Anaemia and blood transfusion are risk factors in the perioperative setting. Effective management begins preoperatively and should be individualized. This article addresses the current evidence base for correction of preoperative anaemia, normalization of iatrogenic and pathological coagulopathy, intraoperative strategies for optimal blood product usage and management of postoperative anaemia.
