

This article provides an overview of the evidence about glyceimic control in the hospital, risk factors for hyperglycemia and hypoglycemia, and the role of infusion nurses in improving outcomes for hospitalized patients with diabetes” Klinkner (2016).

Abstract:

Diabetes is reaching epidemic proportions. Patients undergoing surgery, regardless of diabetes history, are at high risk for complications of poor glyceimic control, including infection, mortality, and longer lengths of stay. This article provides an overview of the evidence about glyceimic control in the hospital, risk factors for hyperglycemia and hypoglycemia, and the role of infusion nurses in improving outcomes for hospitalized patients with diabetes.
