

However, there are very few studies that have addressed iatrogenic pain related to the application of routine procedures at the ED in adults” Ballesteros-Peña et al (2017).

Abstract:

Pain has become the fifth vital sign and it must be evaluated not only in the context of a pathophysiological condition but also as a result of a health intervention [1]. However, there are very few studies that have addressed iatrogenic pain related to the application of routine procedures at the ED in adults.
