The formation of a loop in CVC is a rare complication occurring mostly during right-sided catheterization. We report a rare complication of coiling of left subclavian CVC” Hayaran et al (2017).

Abstract:

Central venous catheter (CVC) placement is not only restricted to Intensive Care Units and operation theaters but its horizon has also expanded to the bedside placements. Meticulous care and aids such as ultrasound and fluoroscopy dramatically increase the successful placement of needles, guidewires, and catheters, but still a large number of catheter misplacements can occur. The formation of a loop in CVC is a rare complication occurring mostly during right-sided catheterization. We report a rare complication of coiling of left subclavian CVC.
