Training in the insertion of the IO access is not a mandatory part of the Danish medical school curriculum or early residency training in Denmark...” Afzali et al (2016).

Extract:

“A recent Danish study shows that the IO device is available in 74% of the Danish Emergency Departments (EDs). However, only 11% consistently established IO access on relevant indication and prior training in the establishment of IO access had not been provided in 47% of the EDs [3]. A lack of introduction and training to the IO device is a possible reason for the limited use as procedural confidence increases after training with hands-on experience [4].
