This paper identifies current recommendations and the specific details for response to occupational exposures to HIV, hepatitis B virus, and hepatitis C virus in the dermatology office. Issues surrounding each virus are discussed individually, and a summary step-by-step algorithm of how to proceed in the event of an occupational exposure is presented” Brewer et al (2017).

Abstract:

Dermatologists and their staff are at risk for needlestick injuries and exposures to body fluids. Despite the availability of treatment to reduce the risk of blood-borne infection, many exposures go unreported. This paper identifies current recommendations and the specific details for response to occupational exposures to HIV, hepatitis B virus, and hepatitis C virus in the dermatology office. Issues surrounding each virus are discussed individually, and a summary step-by-step algorithm of how to proceed in the event of an occupational exposure is presented.
