

This study investigated differences in perceptions of hand hygiene and protective glove use among patients and health care workers (HCWs) in Poland” Wałaszek et al (2018).

Abstract:

This study investigated differences in perceptions of hand hygiene and protective glove use among patients and health care workers (HCWs) in Poland. We conducted a survey using an original questionnaire among 462 respondents, including 173 (37.4%) patients and 289 (62.6%) HCWs; HCWs demonstrated poor familiarity with the My 5 Moments for Hand Hygiene. The role of protective gloves in preventing health care-associated infection was overestimated by both patients and HCWs.
