The objective of this review is to summarize the published evidence regarding the effectiveness and safety of hypodermoclysis in comparison to intravenous fluid infusion for the rehydration of children with mild or moderate dehydration in hospital and home settings” Saganski and de Souza Freire (2019).

Abstract:

The objective of this review is to summarize the published evidence regarding the effectiveness and safety of hypodermoclysis in comparison to intravenous fluid infusion for the rehydration of children with mild or moderate dehydration in hospital and home settings. The question of the review question is: How do the safety and effectiveness of hypodermoclysis compare to those of intravenous fluid infusion for the rehydration of children presenting with mild to moderate dehydration at hospital or home settings?
