

This paper discusses the importance of the functional assessment of vascular access, as well as the examination method and points for diagnosis of venous thrombosis” Ogata and Nishigami (2017).

Abstract:

Ultrasonography is useful not only for screening, but also for evaluating pathological conditions and followup because it can be performed repeatedly and noninvasively at bedside. This paper discusses the importance of the functional assessment of vascular access, as well as the examination method and points for diagnosis of venous thrombosis.
